

# TCAR

## TransCarotid Artery Revascularization

### What is TCAR?

TransCarotid Artery Revascularization (TCAR) is a clinically proven treatment option for carotid artery disease.<sup>1</sup>

The procedure begins with a small incision made just above the collarbone to allow access to the carotid artery (picture A). A sheath (a short hollow tube) is then placed in the carotid artery (picture B). To protect the brain from debris during the procedure, a circuit outside the body directs the blood flow away from the brain and safely back into a vein in the leg. This is called “reverse flow” (picture C) and allows your physician to place a stent (an expandable mesh tube) at the site of the disease for long-term plaque stabilization and stroke prevention.

To learn more about carotid artery disease, the TCAR procedure and the associated benefits and risks, ask your doctor for the ENROUTE® Transcarotid Stent and Neuroprotection System Patient Guidebook or download it at <https://silkroadmed.com/disease-and-treatment-options/>

## Additional Instructions

---

---

---

**NOT FOLLOWING THE ABOVE INSTRUCTIONS  
COULD LEAD TO A POSTPONED PROCEDURE!**

## What to expect after your procedure

- Most patients are able to go home the day following the procedure
- You may experience some pain after this procedure, but it should be minimal
- **Follow all of your physician instructions for taking care of your incision site**
- If you experience unusual headaches, dizziness or other unusual symptoms, call the physician who performed your procedure immediately or dial 911
